Description			
Description: Create functionality to display archived files stored in S3 buckets on the application UI and allow users to download archived files when required.			
Requirements:			
Backend/API Changes Create API to fetch archived file details from S3 bucket. API should return: File Name File Path / Key File Size Archive Date / Upload Date File Type (if applicable) Status (Archived / Available)			
UI Changes Add new section/page for Archived Files. Display archived files in tabular/grid format. Columns: File Name File Size Archive Date File Type Actions Download Functionality Provide Download action/button for each file. Download should securely fetch the file from S3. Handle permission/access validation. Show proper error message if file is unavailable or access fails.			
Optional Enhancements Search / Filter by: File Name Date Range File Type Pagination for large datasets. Acceptance Criteria User can view archived files available in S3 from UI. User can download selected archived files successfully. Proper error handling for missing/inaccessible files. UI remains responsive for large number of archived records. Access control/permissions are enforced.
